Analysis Report

gpu_sum

| Duration | 656.229 μs |
|-------------------------|--------------|
| Grid Size | [1024,1,1] |
| Block Size | [1024,1,1] |
| Registers/Thread | 17 |
| Shared Memory/Block | 24 KiB |
| Shared Memory Requested | 64 KiB |
| Shared Memory Executed | 64 KiB |
| Shared Memory Bank Size | 4 B |

[0] Quadro K620

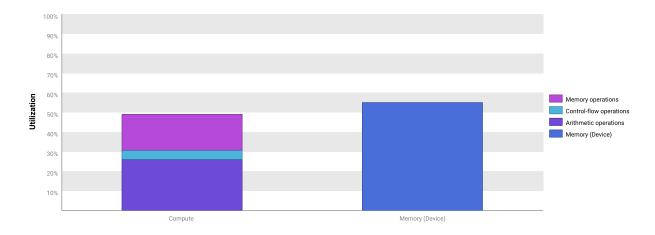

| [U] Quadro Ko2U | | | | | | | | | | |
|---------------------------------------|--|--|--|--|--|--|--|--|--|--|
| GPU UUID | GPU-1ef8bc5c-b0a8-9167-636d-16994a50ac47 | | | | | | | | | |
| Compute Capability | 5.0 | | | | | | | | | |
| Max. Threads per Block | 1024 | | | | | | | | | |
| Max. Threads per Multiprocessor | 2048 | | | | | | | | | |
| Max. Shared Memory per Block | 48 KiB | | | | | | | | | |
| Max. Shared Memory per Multiprocessor | 64 KiB | | | | | | | | | |
| Max. Registers per Block | 65536 | | | | | | | | | |
| Max. Registers per Multiprocessor | 65536 | | | | | | | | | |
| Max. Grid Dimensions | [2147483647, 65535, 65535] | | | | | | | | | |
| Max. Block Dimensions | [1024, 1024, 64] | | | | | | | | | |
| Max. Warps per Multiprocessor | 64 | | | | | | | | | |
| Max. Blocks per Multiprocessor | 32 | | | | | | | | | |
| Single Precision FLOP/s | 863.232 GigaFLOP/s | | | | | | | | | |
| Double Precision FLOP/s | 26.976 GigaFLOP/s | | | | | | | | | |
| Number of Multiprocessors | 3 | | | | | | | | | |
| Multiprocessor Clock Rate | 1.124 GHz | | | | | | | | | |
| Concurrent Kernel | true | | | | | | | | | |
| Max IPC | 6 | | | | | | | | | |
| Threads per Warp | 32 | | | | | | | | | |
| Global Memory Bandwidth | 28.8 GB/s | | | | | | | | | |
| Global Memory Size | 1.946 GiB | | | | | | | | | |
| Constant Memory Size | 64 KiB | | | | | | | | | |
| L2 Cache Size | 2 MiB | | | | | | | | | |
| Memcpy Engines | 1 | | | | | | | | | |
| PCIe Generation | 2 | | | | | | | | | |
| PCIe Link Rate | 5 Gbit/s | | | | | | | | | |
| PCIe Link Width | 16 | | | | | | | | | |
| | | | | | | | | | | |

1. Compute, Bandwidth, or Latency Bound

The first step in analyzing an individual kernel is to determine if the performance of the kernel is bounded by computation, memory bandwidth, or instruction/memory latency. The results below indicate that the performance of kernel "gpu_sum" is most likely limited by instruction and memory latency. You should first examine the information in the "Instruction And Memory Latency" section to determine how it is limiting performance.

1.1. Kernel Performance Is Bound By Instruction And Memory Latency

This kernel exhibits low compute throughput and memory bandwidth utilization relative to the peak performance of "Quadro K620". These utilization levels indicate that the performance of the kernel is most likely limited by the latency of arithmetic or memory operations. Achieved compute throughput and/or memory bandwidth below 60% of peak typically indicates latency issues.

2. Instruction and Memory Latency

Instruction and memory latency limit the performance of a kernel when the GPU does not have enough work to keep busy. The results below indicate that the GPU does not have enough work because instruction execution is stalling excessively.

2.1. Instruction Latencies May Be Limiting Performance

Instruction stall reasons indicate the condition that prevents warps from executing on any given cycle. The following chart shows the break-down of stalls reasons averaged over the entire execution of the kernel. The kernel has good theoretical and achieved occupancy indicating that there are likely sufficient warps executing on each SM. Since occupancy is not an issue it is likely that performance is limited by the instruction stall reasons described below.

Constant - A constant load is blocked due to a miss in the constants cache.

Instruction Fetch - The next assembly instruction has not yet been fetched.

Memory Dependency - A load/store cannot be made because the required resources are not available or are fully utilized, or too many requests of a given type are outstanding. Data request stalls can potentially be reduced by optimizing memory alignment and access patterns.

Not Selected - Warp was ready to issue, but some other warp issued instead. You may be able to sacrifice occupancy without impacting latency hiding and doing so may help improve cache hit rates.

Execution Dependency - An input required by the instruction is not yet available. Execution dependency stalls can potentially be reduced by increasing instruction-level parallelism.

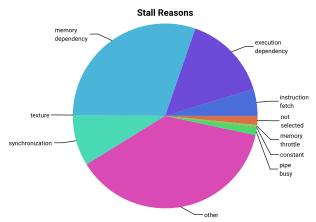

Pipeline Busy - The compute resource(s) required by the instruction is not yet available.

Synchronization - The warp is blocked at a __syncthreads() call.

Memory Throttle - Large number of pending memory operations prevent further forward progress. These can be reduced by combining several memory transactions into one.

Texture - The texture sub-system is fully utilized or has too many outstanding requests.

Optimization: Resolve the primary stall issue; other.

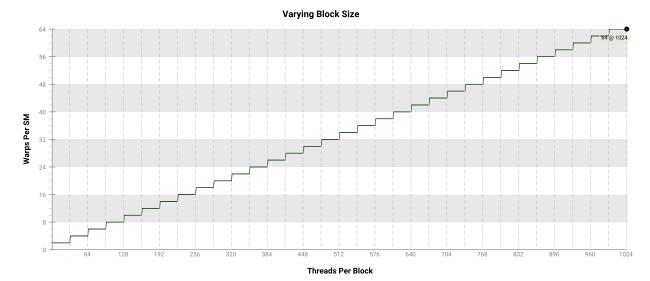

2.2. Occupancy Is Not Limiting Kernel Performance

The kernel's block size, register usage, and shared memory usage allow it to fully utilize all warps on the GPU.

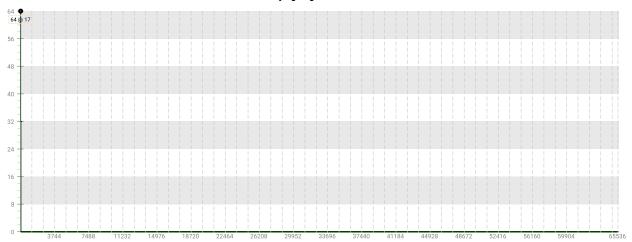

| Variable | Achieved | Theoretical | Device Limit | | Gric | l Size | : [10 | 024,1, ⁻ | 1](1 | 024 b | lock | s) Blo | ock S | Size: [| 1024 | ,1,1] <i>(</i> | (102 | 4 thre | ads) | |

2.3. Occupancy Charts

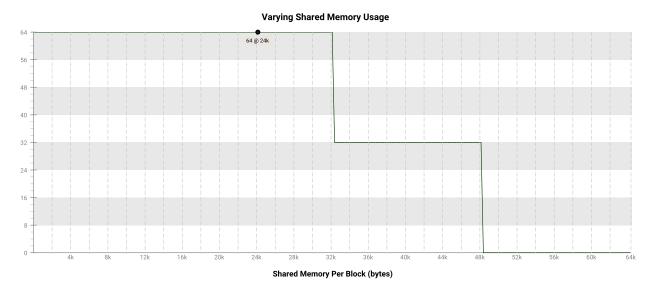

The following charts show how varying different components of the kernel will impact theoretical occupancy.

Varying Register Count

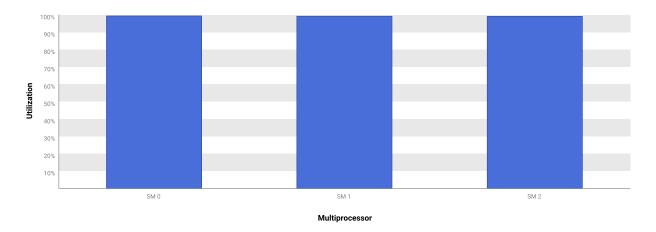

Registers Per Thread

2.4. Multiprocessor Utilization

The kernel's blocks are distributed across the GPU's multiprocessors for execution. Depending on the number of blocks and the execution duration of each block some multiprocessors may be more highly utilized than others during execution of the kernel. The following chart shows the utilization of each multiprocessor during execution of the kernel.

3. Compute Resources

GPU compute resources limit the performance of a kernel when those resources are insufficient or poorly utilized.

3.1. Function Unit Utilization

Different types of instructions are executed on different function units within each SM. Performance can be limited if a function unit is over-used by the instructions executed by the kernel. The following results show that the kernel's performance is not limited by overuse of any function unit.

Load/Store - Load and store instructions for shared and constant memory.

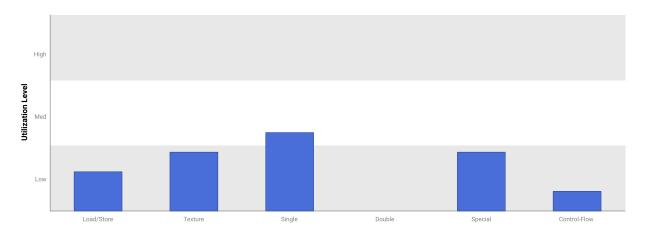

Texture - Load and store instructions for local, global, and texture memory.

Single - Single-precision integer and floating-point arithmetic instructions.

Double - Double-precision floating-point arithmetic instructions.

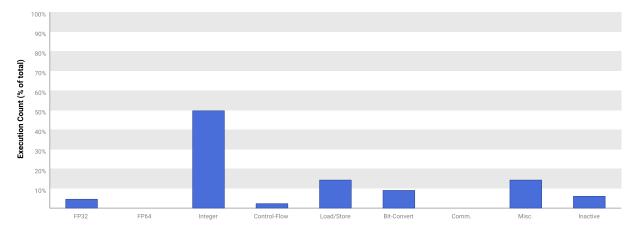

Special - Special arithmetic instructions such as sin, cos, popc, etc.

Control-Flow - Direct and indirect branches, jumps, and calls.

3.2. Instruction Execution Counts

The following chart shows the mix of instructions executed by the kernel. The instructions are grouped into classes and for each class the chart shows the percentage of thread execution cycles that were devoted to executing instructions in that class. The "Inactive" result shows the thread executions that did not execute any instruction because the thread was predicated or inactive due to divergence.

3.3. Floating-Point Operation Counts

The following chart shows the mix of floating-point operations executed by the kernel. The operations are grouped into classes and for each class the chart shows the percentage of thread execution cycles that were devoted to executing operations in that class. The results do not sum to 100% because non-floating-point operations executed by the kernel are not shown in this chart.

4. Memory Bandwidth

Memory bandwidth limits the performance of a kernel when one or more memories in the GPU cannot provide data at the rate requested by the kernel. The results below indicate that the kernel is limited by the bandwidth available to the device memory.

4.1. Memory Bandwidth And Utilization

The following table shows the memory bandwidth used by this kernel for the various types of memory on the device. The table also shows the utilization of each memory type relative to the maximum throughput supported by the memory.
